

Written Submission:  
Pre-Budget Consultations in Advance of the  
Upcoming Federal Budget

By:  
Food Allergy Canada &  
Canadian Society of Allergy and Clinical Immunology (CSACI)

- **Recommendation 1: Recognize food allergy as a chronic health priority that affects entire communities and help to reduce its impact**  
 That the government recognizes food allergy as a chronic disease and funds initiatives to improve individual, healthcare, and community understanding and management of food allergy.
- **Recommendation 2: Improve healthcare utilization for the treatment of anaphylaxis and identify insights to help prevent fatality**  
 That Health Canada’s Strategic Policy Branch collaborates with us to capture improvements in healthcare utilization of emergency departments, and that the government funds a national education program to support the proper treatment of anaphylaxis and national surveillance systems, including a fatality registry, to identify new and emerging risks and insights to help prevent anaphylaxis fatality.
- **Recommendation 3: Support Canada’s food insecure population impacted by food allergy**  
 That the government incorporates an additional \$200 per month into the Canada Child Benefit for eligible families whose children have a food allergy and a tax credit for impacted adults.
- **Recommendation 4: Ensure every Canadian knows what is in their food**  
 That the government incorporates a safe eating strategy within the Healthy Eating Strategy, collaborates with us and the food industry to advance food safety and access to accurate ingredient information, and have the Federal/Provincial/Territorial Food Safety Committee update the Food Retail and Food Services Code to include guidance on food allergy.
- **Recommendation 5: Decrease the prevalence of food allergy through prevention**  
 That the government incorporates evidence-based guidance on the prevention of food allergy through infant feeding into the Nutrition for Healthy Term Infants guidance and in Canada’s Food Guide, and funds a national education program targeting new parents and healthcare professionals.
- **Recommendation 6: Focus health research funding on the most important priorities**  
 That the government prioritizes allergy research and funds efforts to define a patient-centred food allergy research agenda including insights that better serve the needs of Indigenous and structurally-oppressed populations.

## Recommendations

A two-year, \$4.5 million commitment from the Government of Canada to initiate the National Food Allergy Action Plan that, once fully funded and implemented, will save lives, reduce food allergy prevalence, lower healthcare costs, reduce the economic impact, and improve the quality of life for the millions of impacted Canadians.

Food allergy impacts every aspect of life. [Watch Canadians discuss the impact of food allergy \(foodallergycanada.ca/nationalplan\)](https://www.foodallergycanada.ca/nationalplan).

### Facts

- Prevalence of allergic diseases, including food allergy, is at an all-time high with children bearing the greatest burden<sup>1</sup>
- There's no cure for food allergy, avoiding the allergenic food is required to prevent a reaction
- Immunotherapy has proven effective for some resulting in significant improvement in quality of life, but lacks consistent access
- More than 3 million Canadians, including 500,000 children, are affected by food allergy<sup>2</sup> and 1-in-2 Canadian households are impacted<sup>3</sup>
- Food allergy is associated with social and psychological consequences, regardless of ethnicity<sup>4</sup>
- The estimated annual individual cost of having food allergy is \$1.29 billion<sup>5</sup>, and the annual cost of food allergy to the healthcare system is \$588 million<sup>6,7</sup>

### What's needed now

We created the [National Food Allergy Action Plan \(foodallergycanada.ca/nationalplan\)](https://www.foodallergycanada.ca/nationalplan) to spur government leadership and fill voids in policy, public understanding, industry practices, and research commitments in food allergy. The plan provides a framework to guide future investment decisions and policy actions with a focus in prevention, management, treatment, and broad-based community and food system support.

## Recommendation 1: Recognize food allergy as a chronic health priority that affects entire communities and help to reduce its impacts

### Facts

- Almost 50% of patients identified a lack of seriousness around food allergy as a top concern<sup>8</sup>
- Appreciable food allergy knowledge gaps exist, especially among physicians and the public, and quality of life for children with food allergy and their families is significantly affected<sup>9</sup>
- Newcomers to Canada are often not familiar with food allergy, and those with food allergy may be met with skepticism about their condition<sup>10,11</sup>
- Although oral immunotherapy guidelines for food allergy are now available<sup>12</sup>, patients lack consistent access to this treatment

### What's needed now

We request PHAC to recognize food allergy as a chronic disease and collaborate on programming to help reduce its impact. This will help to increase its recognition as a serious medical condition that requires broad-based support for its management. Federal leadership with provincial support is needed to liberate access to emerging therapies, ensuring everyone has the same opportunities to medical interventions.

With 50% of Canadian households affected by food allergy, the cost and impact of food allergy goes beyond those who live with it. We request the government to fund individual, healthcare, and community educational programming to increase the awareness and knowledge of food allergy, including building capacity for treatment options. The programming will be translated into priority languages, ensuring inclusivity for Indigenous and immigrant populations.

## Recommendation 2: Improve healthcare utilization for the treatment of anaphylaxis and identify insights to help prevent fatality

### Facts

- Over a 4-year timeframe, the number of emergency department visits for anaphylaxis has more than doubled<sup>13</sup>
- Children who didn't receive prompt administration of epinephrine were more than 2x more likely to be admitted to hospital<sup>14</sup>
- Pre-hospital use of epinephrine is low<sup>15</sup>
  - EMS usage of epinephrine to treat anaphylaxis in Canada is only 36%
  - Only 21% of children and 7% of adults globally use their auto-injector prior to going to hospital
- Less than 50% of patients have access to an epinephrine auto-injector, life-saving medication that is the only treatment for anaphylaxis<sup>16</sup> and Canadians with low education are even less likely to be prescribed one<sup>17</sup>

### What's needed now

Delay or failure to treat anaphylactic reactions result because patients cannot access or afford epinephrine auto-injectors or are confused on the symptoms of reactions and when to act.

National education programs, access to epinephrine, and insight through national anaphylaxis surveillance systems are essential to improve the quality of life for impacted Canadians.

We would like to collaborate with Health Canada’s Strategic Policy Branch to validate improvements in healthcare utilization of emergency departments. Recent studies show that some post-anaphylaxis practices are associated with a significant burden on healthcare resources and provide low value patient care.

We also request funding for national surveillance systems, including a fatality registry, to identify new and emerging risks, prevalent triggers of concern, and insight into preventing anaphylaxis fatality.

### Recommendation 3: Support Canada’s food insecure population impacted by food allergy

#### Facts

- Prior to COVID-19, households managing food allergy spent on average \$2,400 more annually on food.<sup>5</sup> Families managing food allergy report spending even more on food now vs. before the pandemic.<sup>18</sup>
- Due to higher costs, households managing food allergy report buying less preferable foods (e.g., with precautionary allergen labels).<sup>19</sup>

#### What’s needed now

That the government incorporates an additional \$200/month into the Canada Child Benefit for eligible families whose children have a physician-diagnosed food allergy and a tax credit for impacted adults. This would help offset the excess costs of food allergy-safe foods and minimize the risk of accidental exposure to known allergens.

### Recommendation 4: Ensure every Canadian knows what is in their food

#### Facts

- One-third of anaphylactic reactions in children are attributed to food labelling-related issues<sup>20</sup>
- There has been a significant proliferation in the use of “may contain” statements, along with misuse within the industry and an increasing number of consumers questioning their validity<sup>21</sup>

#### What’s needed now

Canadians managing food allergy need more from the current Healthy Eating Strategy; they require a safe eating strategy and easy-to-access ingredient information to make informed and safe food choices.

Access to accurate ingredient information, particularly outside pre-packaged foods, and within the foodservice industry, will help Canadians navigate choices and live more confidently, while enabling food operators to capture this important segment.

COVID-19 highlighted gaps in access to accurate ingredient information when ingredient statements on online pre-packaged food did not consistently match the package received, making it difficult for the food allergy community to remain safe and avoid their allergens.

We request the government incorporates a safe eating element to the Healthy Eating Strategy, collaborates with us and the food industry to advance food safety and access to accurate ingredient information, and update the Food Retail and Food Services Code to include guidance on food allergy.

## Recommendation 5: Decrease the prevalence of food allergy through prevention

### Facts

- Nearly 25,000 infants per year will be diagnosed with a food allergy<sup>22,23</sup>
- Introducing peanut between 4-11 months of age has shown a reduction in peanut allergy in high-risk infants by 80%<sup>24</sup>
- A 50% reduction in peanut and egg allergy alone could reduce excess household costs by \$3.3 billion<sup>5</sup> and prevent 20,000 emergency department visits over a 10-year basis<sup>23,25</sup>

### What's needed now

Research demonstrates that food allergy can be prevented in some through the introduction of allergenic foods in infancy. This strongly contradicts past healthcare guidance.

Expectant parents must receive consistent, evidence-based, and easy-to-understand advice and support on food allergy prevention through a comprehensive and well supported public education effort including updating the Nutrition for Healthy Term Infants guidance and Canada's Food Guide. This effort will help ensure parents understand the importance of introducing and keeping allergenic foods in the diet.

## Recommendation 6: Focus health research funding on the most important priorities

Research is needed to determine the unique needs of Indigenous and structurally-oppressed populations with food allergy in Canada. A patient-centered research agenda, rooted in patient engagement and focused on improving quality of life for impacted Canadians, is also required. We request the government funds this effort to inform research priorities and enable effective allocation of research spending.

### Make food allergy count

Policymakers must look to what can be done to effectively prevent and manage food allergy. We have the tools, evidence-based research, and best-practice examples available to make progress today.

This modest commitment from the government would result in practical executions of critical food allergy education and interventions and represent a wise investment in a long-term comprehensive strategy.

It would also be a positive signal to the millions of Canadians living with the daily and potentially life-threatening impacts of food allergy that their government regards their health with the seriousness it deserves.

*Jennifer Gerdts, Executive Director, Food Allergy Canada  
Dr. Harold Kim, Past President, CSACI*

## What's food allergy?

- Food allergy is an abnormal immune response to food where the immune system mistakenly treats a particular food protein as if it's harmful and causes an allergic reaction
- Anaphylaxis is a serious allergic reaction that is rapid in onset and may cause death<sup>26</sup>

## Lead organizations

Food Allergy Canada: National non-profit and Canada's leading patient organization providing education and support to navigate food allergy, building informed and supportive communities, and acting as the national voice on key issues.

CSACI: Canadian organization for health professionals in allergy, asthma, and clinical immunology. Mission is to advance allergy, asthma, and immunology knowledge to optimize patient care. They are a member society of the WAO and the CMA.
